

The Relay Platform — Product Guide

Modules, capabilities and how they fit together

What Relay is

Relay is a field service management platform. It takes work that needs doing at a physical location, decides who should do it and when, puts that work in a technician's hand on a mobile device, and records what actually happened so it can be billed, audited and improved.

Relay is delivered as software as a service. There is no on-premises deployment option. Customers access the platform through a web application for office users and native mobile applications for field users.

Modules

Relay Dispatch

The planning and scheduling module, used by dispatchers and planners in the office. Dispatch holds the work order lifecycle, the technician roster, skills and certifications, parts availability, and the constraint-based scheduling engine that proposes assignments.

- Work order management from creation through to invoicing hand-off
- Drag-and-drop schedule board with day, week and technician views
- Constraint-based automatic scheduling considering skills, certifications, working time, travel, parts and customer time windows
- Explainable assignments — every proposal lists the constraints that produced it
- Recurring and planned preventive maintenance schedules
- Capacity forecasting up to 90 days ahead

Relay Mobile

The native application technicians use on site, available for iOS 16 and above and Android 11 and above. Relay Mobile is designed to work without connectivity: a technician can download a day's work, complete every step offline, and synchronise when signal returns.

- Full offline job execution with automatic conflict-safe synchronisation
- Guided job steps, checklists and dynamic forms
- Photo, video and signature capture with location and timestamp metadata
- Parts consumption and van stock tracking
- Health and safety checks, including lone-worker check-in
- Navigation hand-off to the device's preferred mapping application

Relay Insights

The reporting and analytics module. Insights provides first-time-fix rate, mean time to repair, schedule adherence, travel time, utilisation and SLA attainment, broken down by team, region, work type or customer.

- Twenty-two standard reports covering operations, quality and cost
- Scheduled exports to email, secure FTP or object storage

- Twelve months of history on Professional; twenty-four months with Insights Advanced
- Custom dashboards (Insights Advanced only)

Relay Connect

The integration framework. Connect provides pre-built connectors to common business systems, a REST API, outbound webhooks, and a GraphQL API currently in beta.

- Pre-built connectors — see the integrations catalogue for the current list
- REST API with an OpenAPI 3.1 description
- Outbound webhooks on 34 event types
- GraphQL API (beta, Enterprise only)
- API allowance of 100,000 calls per month on Professional and 500,000 on Enterprise

How a job flows through Relay

- A work order is created — raised by a planner, generated by a maintenance schedule, or pushed in from a CRM or ERP through Relay Connect.
- Dispatch evaluates constraints and proposes a technician and time slot. A planner can accept, override or lock the proposal.
- The job appears on the technician's device. If they will be working without signal, the day's work downloads in advance.
- The technician completes the job — guided steps, checklists, photographs, parts used, customer signature.
- The completed job synchronises back, closing the work order and releasing it to billing.
- Insights records the outcome against first-time-fix, SLA attainment and utilisation.

Platform limits

Limit	Essentials	Professional	Enterprise
Technicians	25	Unlimited	Unlimited
Work orders per month	5,000	50,000	Unlimited
Custom forms	10	100	Unlimited
API calls per month	Not available	100,000	500,000
Integrations	None	3	Unlimited
Attachment storage	50 GB	500 GB	2 TB
Sandbox environments	None	None	1 included

Supported browsers and devices

- Web application — the current and previous major versions of Chrome, Edge, Firefox and Safari
- Relay Mobile for iOS — iOS 16 or later
- Relay Mobile for Android — Android 11 or later
- Rugged devices — tested on Zebra TC series and Samsung Galaxy XCover
